

Dragging/Clicking from Clip Builder

Add a message/browser action against a specific target and an operation/action by using the Test Clip Builder in the lower panel of the SOASTA CloudTest Clip Editor. First, verify that the "Test Clip Builder" button is selected in the bottom toolbar of the lower panel. Then verify that the "Messages/Action" button is selected in the upper toolbar of the lower panel. Find the target that you want to build your test clip against. Double click on the target to push it from the "Available Targets" list to the "Included Targets" list. The operations/actions of that target will then be displayed in the "Operations/Actions" list in the far right of the Test Clip Builder. Find the operation/action that you want to use and either double click on it to add it to the test clip after the currently selected clip element, or grab it from the list and drag it upwards and drop the message/browser action at any location in the test clip.
